Eden Prairie, MN -- February 27, 2007 -- Positive Access Corp. (PAC) has announced the release of IDecode® Version 3.02, the firm's driver's license parsing software which offers the most user-friendly and reliable ability to acquire and update the capacity to capture the data on US state and Canadian provincial driver's ID's, as well as military ID cards and leading credit cards.

Included in the V.3.02 update is the capacity to handle three new state/province ID formats, as well as changes that improved the parsing of nine additional state formats.

Also, Positive Access added new features to make development of applications easier when using the IDecode product line.

The upgraded capacity of V.3.02 is cumulative and has been added to all the product lines of IDecode, which include the ActiveX DLL, .NET DLL, and the Windows Mobile DLL. The updates have also been applied to PAC's special .NET Server product.

Positive Access Corporation's history of developing and marketing driver's license reading products goes back over ten years, and the company's IDecode line of products has been offered since 2000. This is the 13th consecutive upgrade provided to licensees who have acquired PAC's IDecode line of products.

PAC's on-going R&D process gives product developers seeking to use driver's ID data the logic required to decode each of the many possible versions of a state license via a process that combines extensive look-back knowledge of existing formats and constant attention to newly discovered formats. More information about PAC products may be found on the company's web site at www.positiveaccess.com
